

Fractional freezing Wikipedia Fractional freezing is a process used in process engineering and chemistry to separate substances with different melting points It can be done by partial melting of a solid, for example in zone refining of silicon or metals, or by partial crystallization of a liquid, as in freeze distillation, also called normal freezing or progressive freezing. The initial Freezing point depression Wikipedia Freezing point depression is the decrease of the freezing point of a solvent on addition of a non volatile solute. Examples include salt in water, alcohol in water, or the mixing of two solids such as impurities into a finely powdered drug.
